

PlaceMux — Ship / No-Ship Decision Memo

Generated 2026-07-25 14:22 UTC

Experiment	Primary Metric	Lift-value	SRM	Guardrails	Decision
Resume Upload Simplification	+9.90%	0.0113	clean	clean	Ship
Aggressive Push Notification Frequency	+9.85%	0.3910	clean	3 regression(s)	No Ship
New Job Recommendation Ranking Model	+6.92%	0.2291	clean	clean	No Ship
Onboarding Checklist Redesign	+1.39%	0.7431	FLAGGED	clean	Rollback

Detailed Reasoning

Resume Upload Simplification — Ship

- No statistically significant guardrail regressions detected.
- Primary metric 'application_conversion': control=0.231008, treatment=0.253891, relative lift=+9.90%, p-value=0.01132 (Two-Sample Z-Test (pooled proportions)).
- 95% CI for the difference: [0.00518, 0.040584].
- Effect is statistically significant at 95% confidence and the +9.90% relative lift is practically meaningful ($\geq 1.0\%$ threshold).
- Observed statistical power: 0.72.

Aggressive Push Notification Frequency — No Ship

- Guardrail 'cancellation_rate' regressed: control=0.0187 -> treatment=0.0294 (+56.9% relative, p=0.0013, statistically significant at 95%).
- Guardrail 'error_rate' regressed: control=0.0234 -> treatment=0.0306 (+31.0% relative, p=0.0392, statistically significant at 95%).
- Guardrail 'refund_rate' regressed: control=0.0083 -> treatment=0.0182 (+118.2% relative, p=0.0001, statistically significant at 95%).
- One or more guardrail metrics moved significantly in the harmful direction. Per policy, guardrail regressions block shipping regardless of the primary-metric result.

New Job Recommendation Ranking Model — No Ship

- No statistically significant guardrail regressions detected.
- Primary metric 'application_conversion': control=0.236193, treatment=0.252535, relative lift=+6.92%, p-value=0.229088 (Two-Sample Z-Test (pooled proportions)).
- 95% CI for the difference: [-0.010293, 0.042977].
- Result is not statistically significant (p=0.229088) and the experiment was adequately powered to detect a practically meaningful effect. This is honest evidence of no meaningful effect on the primary metric.

Onboarding Checklist Redesign — Rollback

- Sample Ratio Mismatch detected (control=4169, treatment=2831, expected 50/50, chi2 p=0.0).
- Randomization integrity cannot be confirmed, so the primary-metric and guardrail results below cannot be trusted for a ship decision.
- Severe SRM detected. The randomization is broken for this experiment. All primary-metric, guardrail, and CI results below are INVALID and must not be used for a ship/no-ship decision. Halt the experiment, fix the assignment pipeline,

and re-launch.
